

Lopez Valve[®]

Closed Enteral Tube Valve

Provides access to enteral systems without opening lines, protecting healthcare workers from exposure to gastric fluids and bloodborne pathogens.

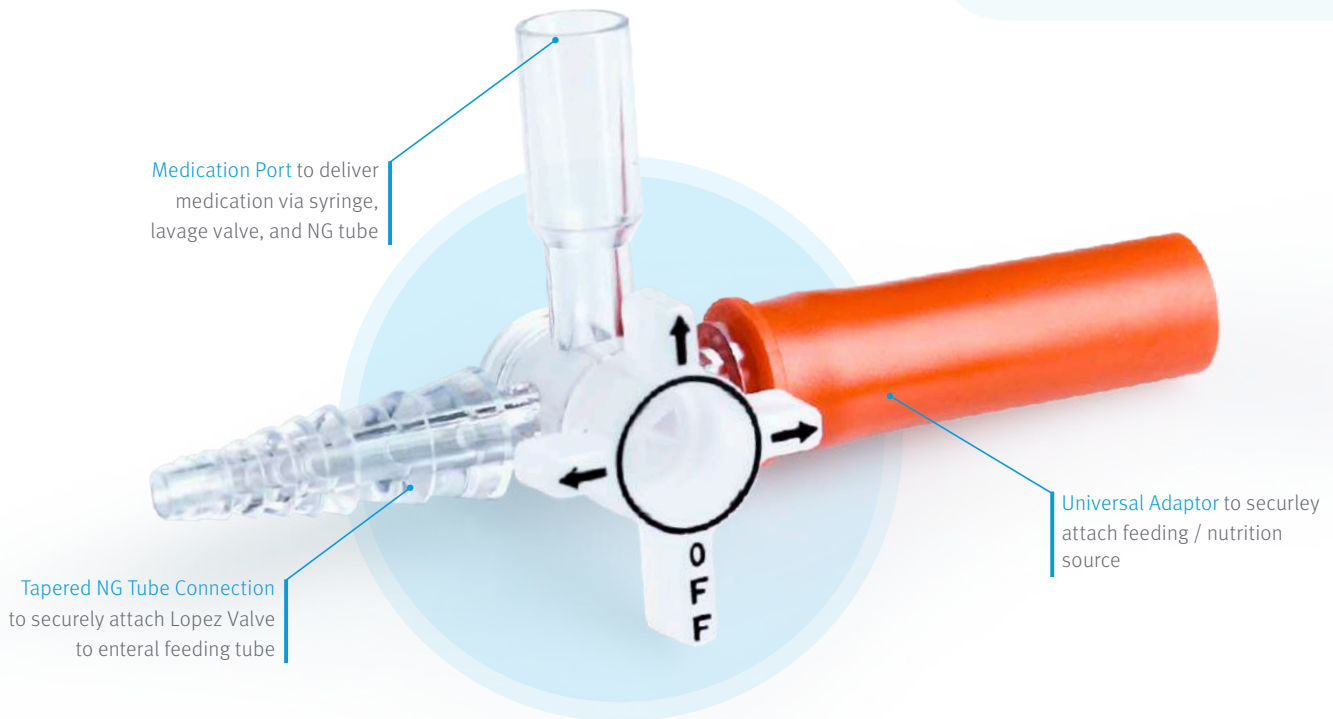

Maintain a closed system throughout enteral feeding, drug administration, and suctioning procedures.

The Lopez Valve is designed to help you save time by eliminating the use of nasogastric (NG) tube plugs and poor syringe connections while keeping you safe from accidental exposure to infectious bodily fluids.

The Lopez Valve can help your efforts to:

- > Avoid unnecessary line manipulation and disconnections required to deliver medications.
- > Reduce exposure to potentially infectious bodily fluids or gastric secretions.
- > Facilitate gastric lavage without risk of splashing.

Lopez Valve Item Numbers

List Number	Product Description
M1-9000	Lopez Valve, Non-Sterile
M1-9000-T	Lopez Valve, Tethered Cap, Sterile
M1-9000-S	Lopez Valve, Sterile

Maintaining a closed system to help keep you and your patients safe.
