Suggested For Physical Conditions:

Anterior Pelvic Tilt • Pelvic Rotation • High Tone

Suggested For Wheelchair Conditions:

Positions the Pelvis in the Chair

2-Point vs 4-Point Hip Belts

2-Point Hip Belts

Includes 2 straps with 2 points of attachment, commonly used on clients with posterior pelvic tilt, pelvic obliquity and/or low tone. Positioning of the hip belt to the seat varies between a 60 to 90 degree angle based on the desired outcome.

Choose the angle that best positions the pelvis, in conjunction with preventing the client from sliding out from underneath the hip belt.

4-Point Hip Belts

Includes 4 padded straps with 4 points of attachment, commonly used on clients with anterior pelvic tilt, pelvic rotation and/or high tone.

For optimum effectiveness, center the buckle and pad between the hips. Use the top straps to pull the hips back, stabilizing the lower spine.

Commonly, the bottom straps are pulled down across the pelvis to position it at 90°. Once straps are installed and pad is centered, use the pull rings to adjust the length.

Buckle Styles

Side Release

Side Release buckles require gently squeezing to release.

Side Release buckles are an economical option.

Push Button

Push Button buckles are available in spring or non-spring styles.

Spring push button buckles are recommended for clients who want to easily release the buckle by pressing the button. Non-Spring buckles require both pressing the button and pulling the buckle apart to release.

Lever Release

Lever Release buckles are durable and easy to release with limited hand function.

The client pulls the top top latch to release.

Pull Styles

Center Pull

Center-Pull Hip Belts include **one** D-Ring to pull for adjustment. Pull the D-Ring away from the buckle to tighten.

A single D-ring pull is typically easier for the client to tighten the belt with a single movement.

Dual Pull

Dual-Pull Hip Belts are similar to a Center-Pull but they include **two** D-rings to pull for adjustment. Pull both the left and right D-rings **away** from the buckle to tighten.

Two D-ring pulls allow the caregiver to adjust each side of the pelvis independently.

Rear Pull

Rear-Pull Hip Belts include **two** D-rings to pull for adjustment. Pull both the left and right D-rings **towards** the buckle to tighten.

Two D-ring pulls allow the caregiver to adjust each side of the pelvis independently.
