Standing the Elderly Improves Their Quality of Life

Often the elderly are overlooked for a standing program that can greatly improve their quality of life. People in long-term care centers, transitional care centers, or nursing homes can benefit from an ongoing standing program. The EasyStand StrapStand is a popular choice for long-term care settings, where transfers are often limited.

Standing the Elderly Improves Their Quality of Life

## Multiple Benefits

Clients who participate in a standing program while in a skilled nursing facility often demonstrate progress markers such as: decreased need for assistance, gaining range of motion, better balance, and others. Standing can also help a person gain or refine motor skills and proprioception, which helps them progress towards a gait program. With measurable gains from standing, it is easier to justify more therapy to the payer to continue your client's progress. Plus, treating a client in a stander may allow a therapist to multi-task.

## No Transfer

Many people in long-term care should be standing, and the EasyStand StrapStand makes it possible. With the StrapStand, the patient can be lifted directly out of their wheelchair, bed or recliner. There is no need for patient lifting/transferring that may be a concern to staff and caregivers.

## Shadow Tray

Another option for standing is the EasyStand Evolv. It offers a natural transition to standing with a padded seat. The unique Shadow tray, exclusive to the Evolv, safely and securely follows the user as they go from sitting to standing.
